### **DETAILED ACTION**

The amendment filed 8/20/09 has been entered, Claims 1-5 and 11-16 remain pending in the application.

#### ***Allowable Subject Matter***

Claims 1-5 and 11-16 are allowed.

The following is an examiner's statement of reasons for allowance: The present invention discloses a method for producing a preform for optical fibers, comprising: doping SiO<sub>2</sub> on the glass cylinder by rotating the glass cylinder over a plasma burner with a silicon-containing starter substance. The starter substance is oxidized in the flame to produce SiO<sub>2</sub> particles in layers on the glass cylinder in the presence of fluorine. The plasma flame emits UV light in one or more wavelengths at 214nm at an intensity of at least 0.9uW.

Rau (US 4162908) teaches a method for producing glass where a silicon compound is heated by a plasma burner and oxidized (column 1 lines 64-68 and column 2 lines 1-2). The process is done in an oxygen environment, which produces silicon oxide (column 1 lines 24-27). The silicon compound is then oxidized in the presence of fluorine and deposited on the refractory support (column 2 lines 23-30). the oxidizing of a silicon compound in the presence of fluorine creates a fluorine doped silicon compound (column 1 lines 21-28). Rau also teaches that the shape of the refractory support is a cylinder, which is a rod (column 2 lines 32-41). The rod can rotate during the depositing

process doing so along its longitudinal axis (column 3 line 68, column 4 lines 1-3 and figure 2). Rau does not teach the wavelength or the intensity of the plasma burner.

Ohga (US 5474589) teaches that quartz glass has defects between 165 and 250nm (column 2 lines 5-19). It teaches that the absorption of the wavelengths is avoided by fluorine-doping (column 2 lines 50-60). In order to fluorine-dope the glass, a plasma burner is used (column 3 lines 48-61). Ohga does not teach the intensity or the wavelength of the plasma burner.
